4. Track Contact Us form submissions as a conversion

(A.) Create the trigger :-

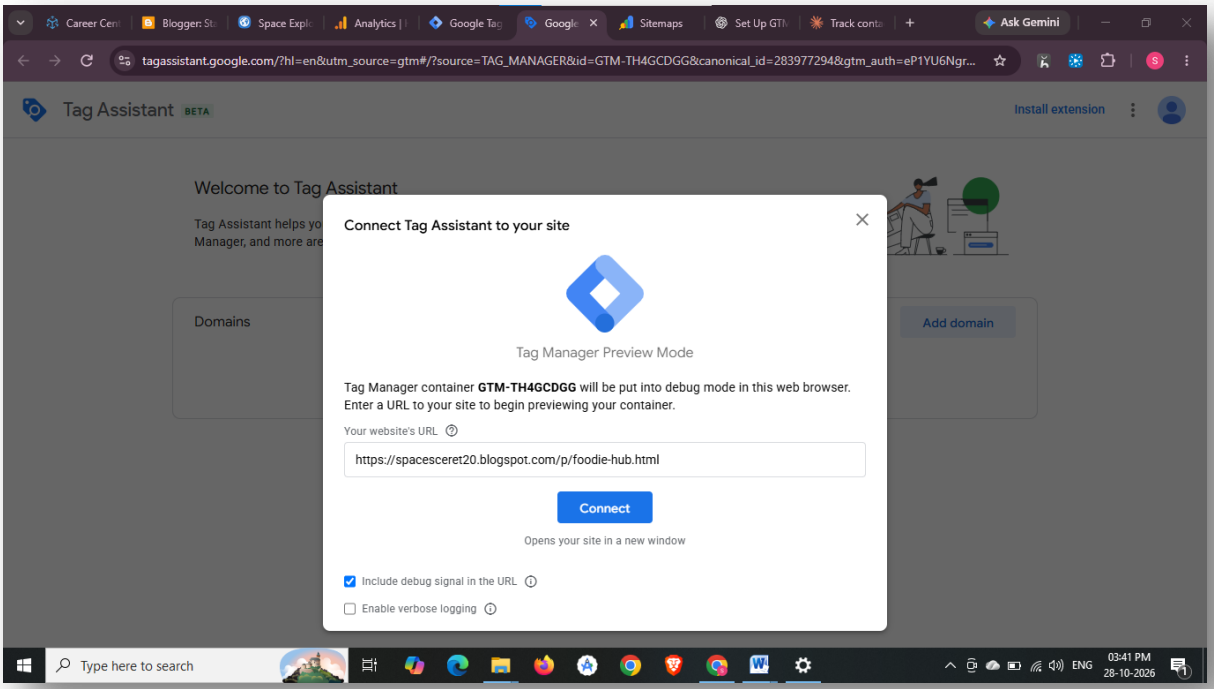

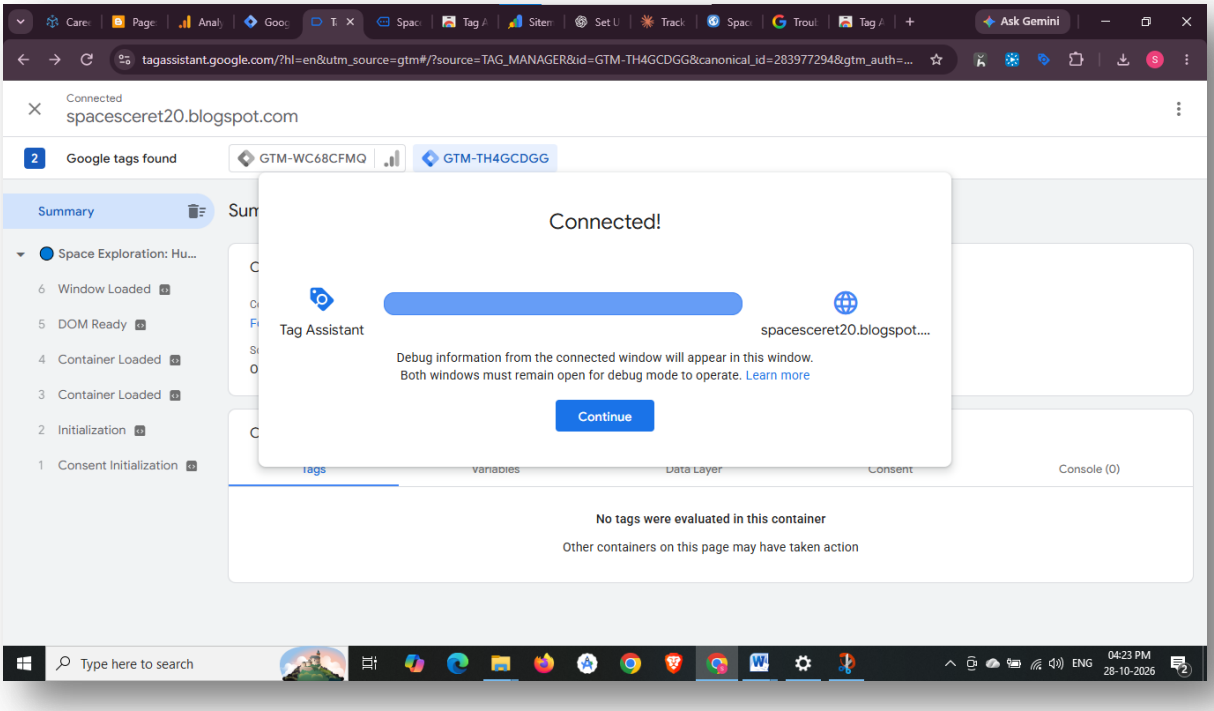

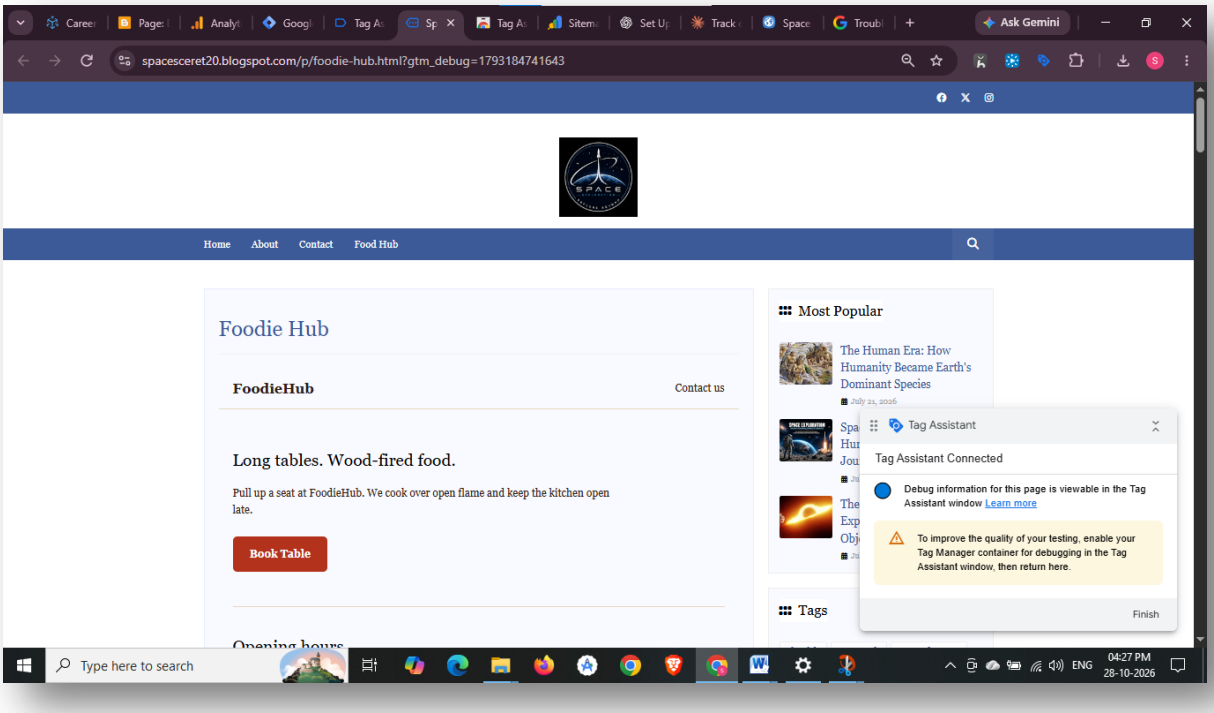

(B). Troubleshoot a Book Table tag that is not firing:-

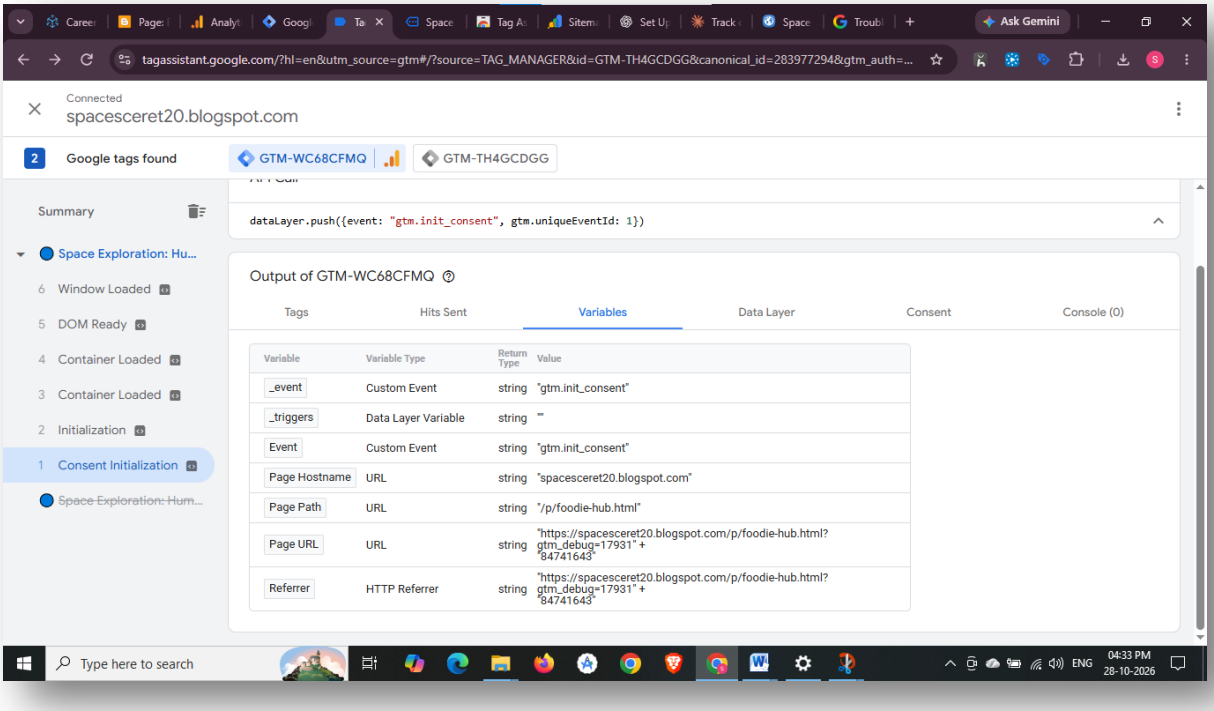

Step 1: Connect Preview mode :-

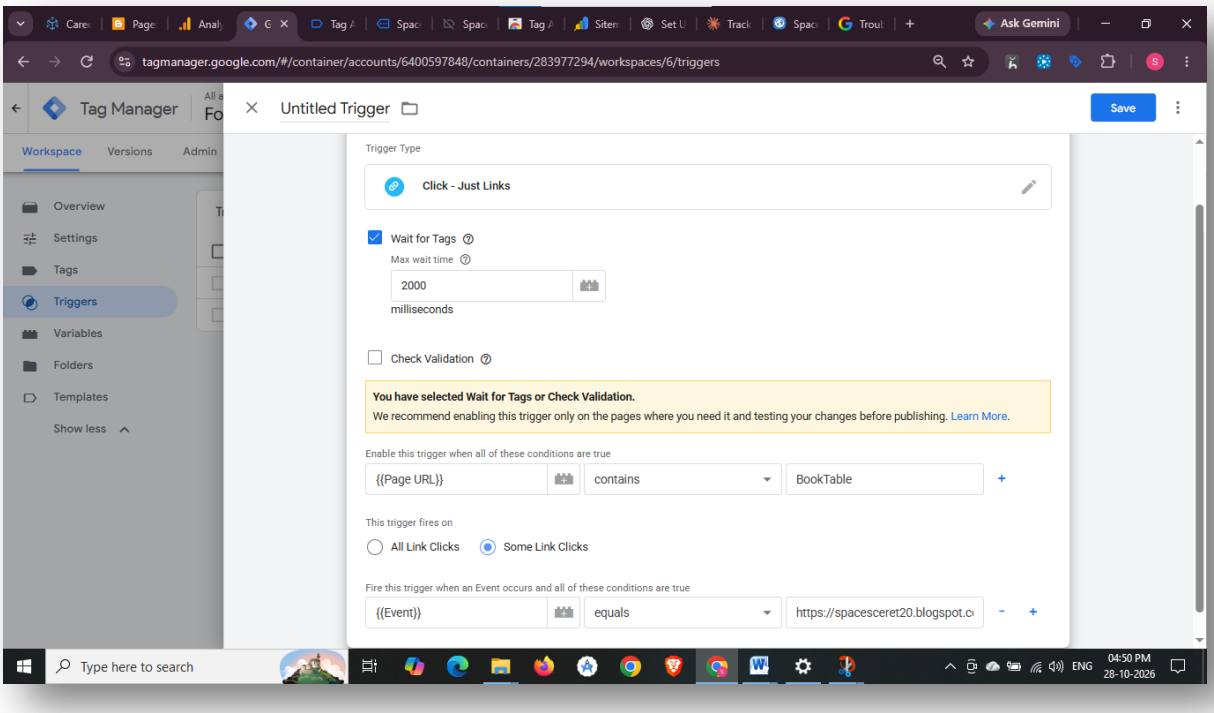

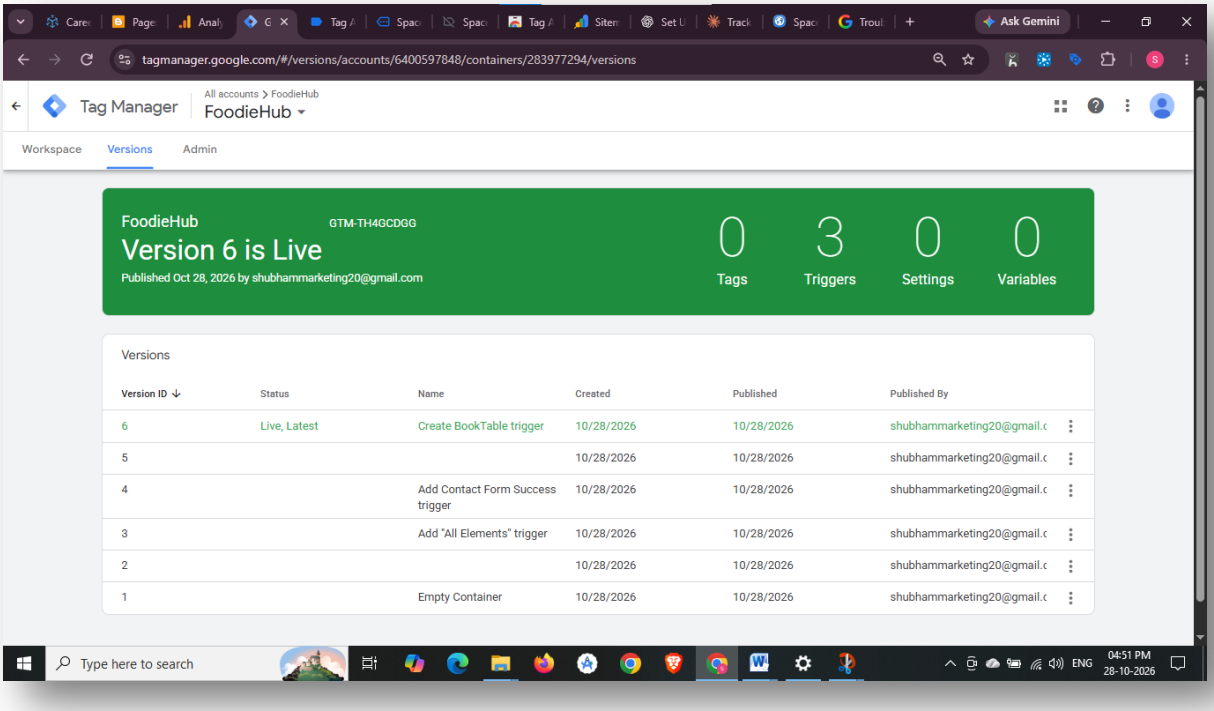

Step 2: Click Book Table :-

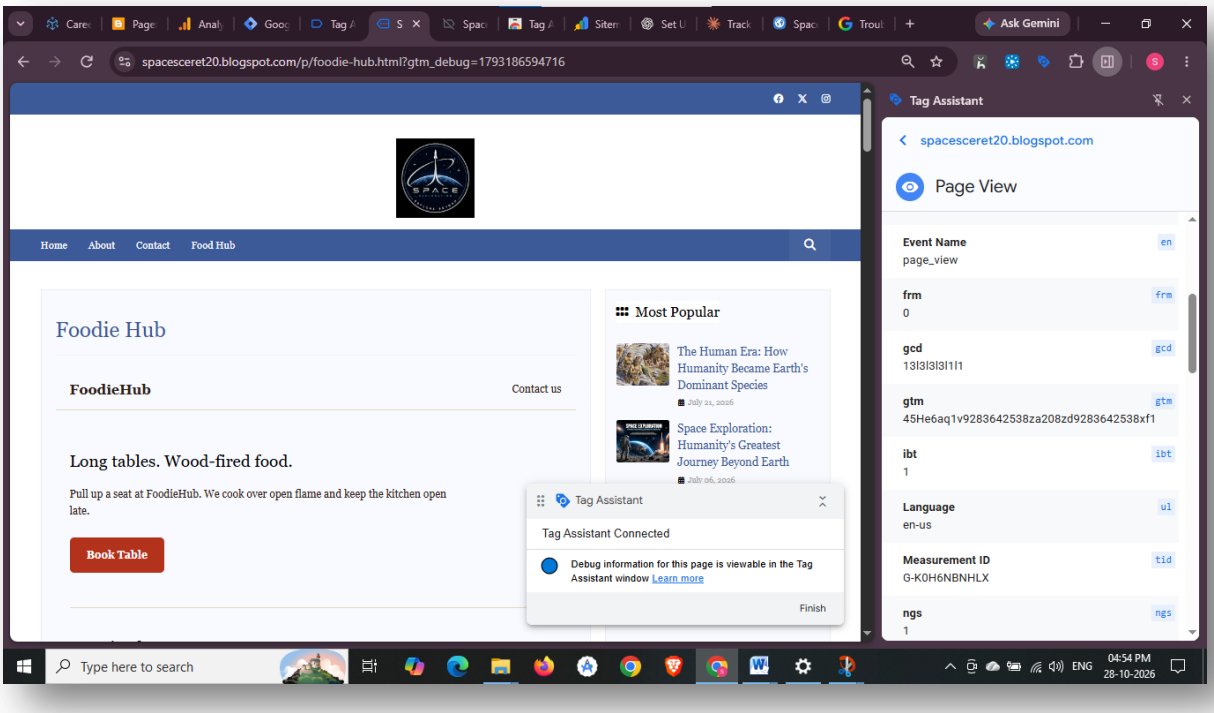

Step 3: Correct the trigger :-

Step 4: Test again

Troubleshooting result for the assignment:

Problem	Incorrect Click ID condition

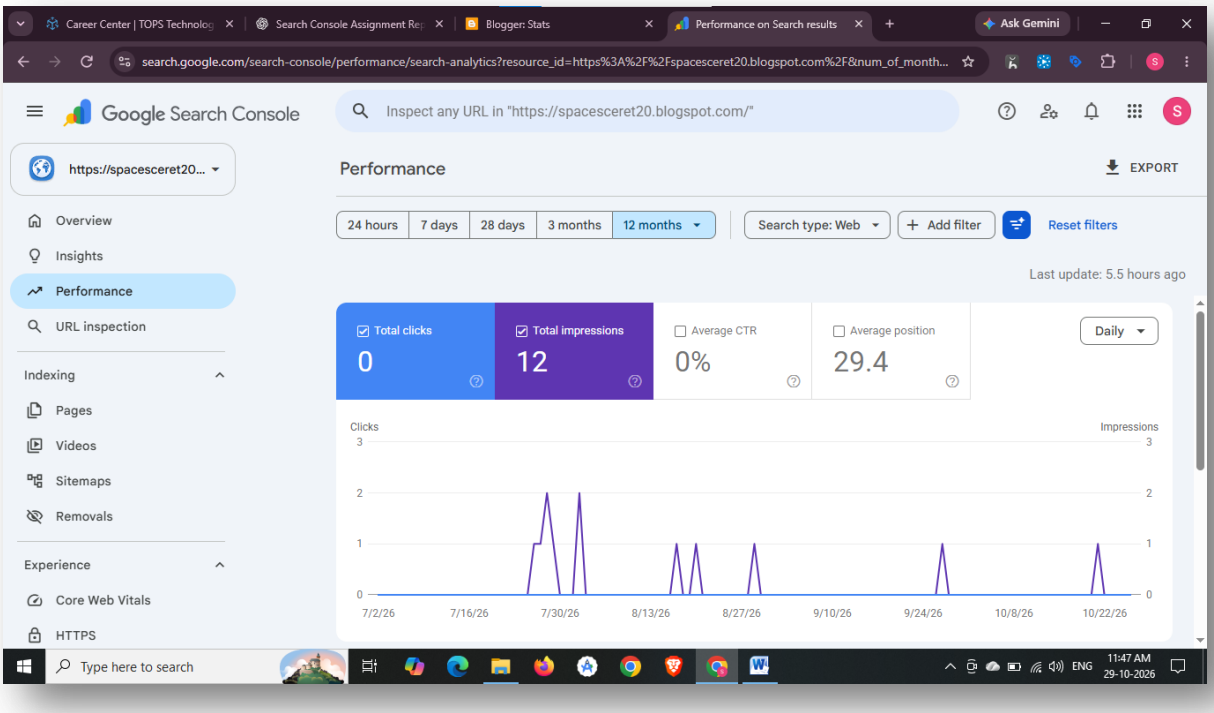

identified	
Cause	The trigger expected `book-table`, but the button's actual ID was `book-table-btn`.
Fix applied	Updated the trigger condition to `Click ID equals book-table-btn`.
Expected result	The GA4 event tag fires when Book Table is clicked.

This is the documented simulated troubleshooting result; you must run Preview mode yourself to confirm it on your page.

---

2. Identify an unexpected spike or drop

3. Ask Analytics Intelligence a question

Question entered:

Why did my bounce rate increase yesterday?

The increase in bounce rate may be associated with visitors leaving the website without engaging further. Possible contributing factors include slow page loading, irrelevant landing-page content, low-quality campaign traffic, or a poor mobile experience.

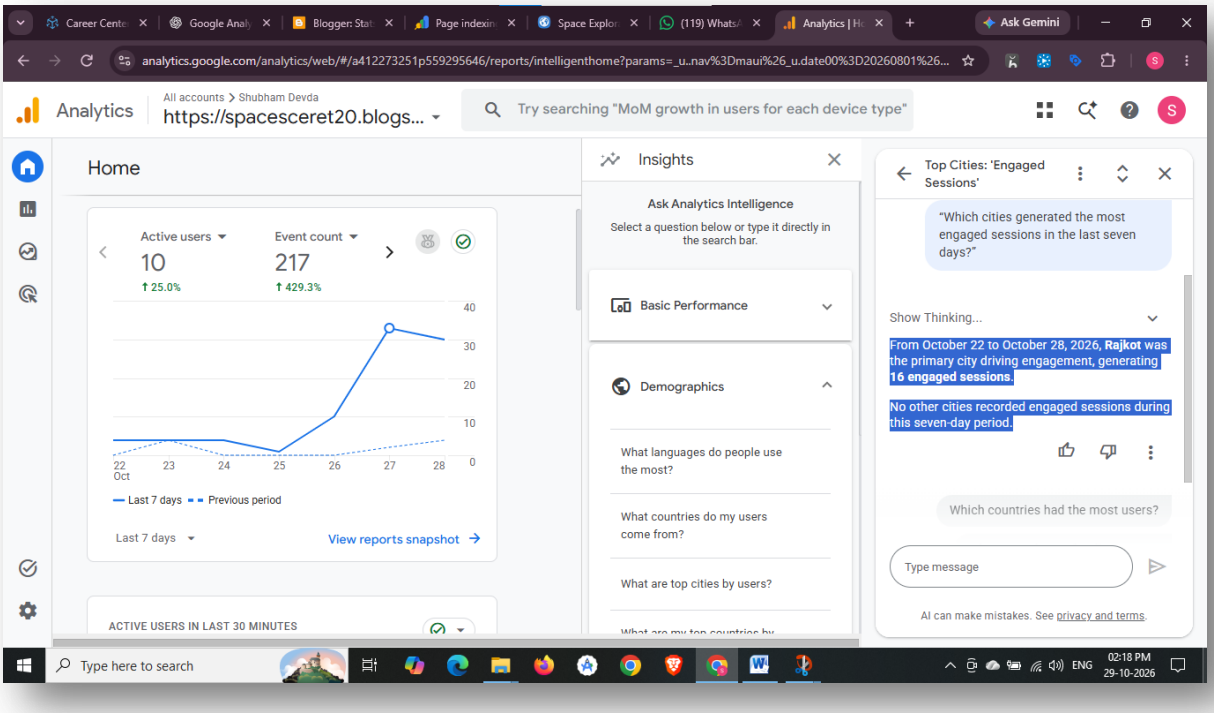

My interpretation: The website should be checked for page-speed problems, content relevance, and differences between mobile and desktop visitors. These are possible explanations, not confirmed causes.

Google's current conversational feature is called Ask Advisor in eligible GA4 properties. Open the Google Analytics search box, select Ask Advisor if available, and ask a natural-language question. Its response uses data from the selected property and may not always be correct.

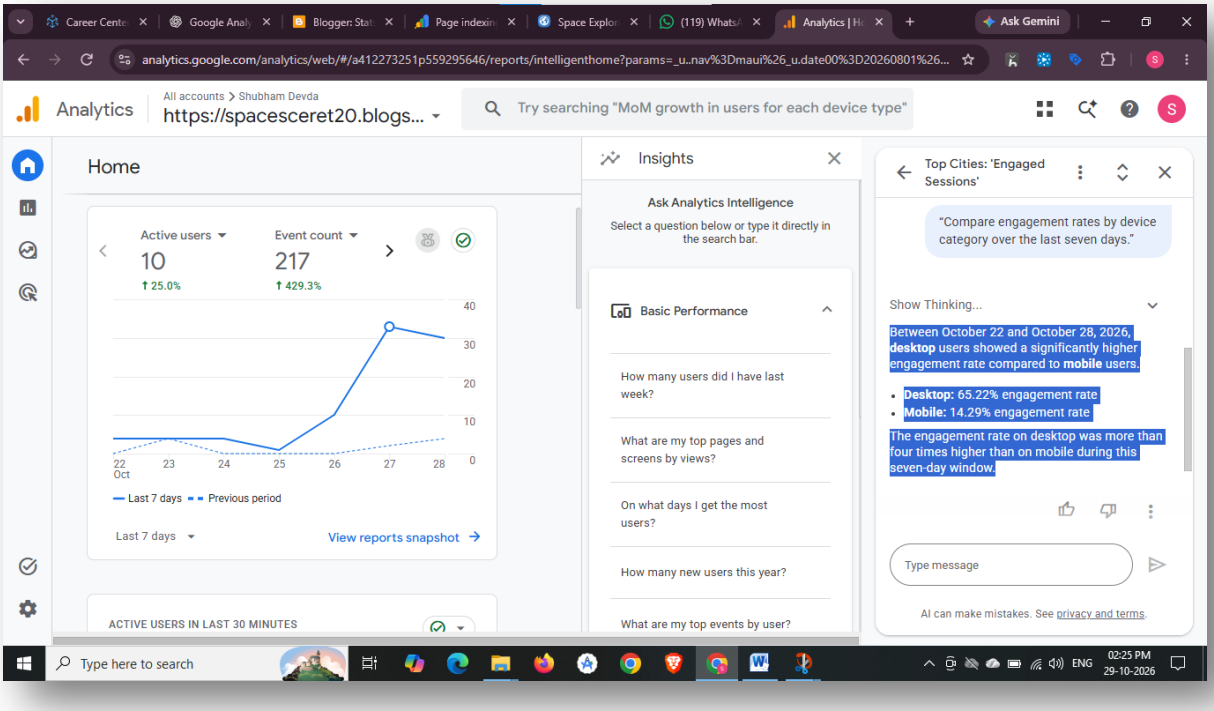

---

4. Compare two AI-generated insights

(1) Which cities generated the most engaged sessions in the last seven days?

(2) Compare engagement rates by device category over the last seven days.

---

5. Use ChatGPT to interpret a traffic report

For this sample analysis, assume the traffic report shows that mobile users have a higher bounce rate and that engagement has decreased on the landing page.

Sample traffic report

Illustrative figures for the assignment

Metric	Result
Users	1,250
Engagement rate	42%
Bounce rate	58%
Mobile traffic share	70%

Two actionable recommendations from the AI analysis:

1. Improve mobile user experience: Optimize images, reduce loading time, simplify navigation, and ensure that buttons and forms work correctly on mobile devices.
2. Improve landing-page engagement: Match page content to the visitor's search intent, use clear headings, provide relevant content, and add visible calls to action.

These changes should be tested and evaluated using engagement rate, engaged sessions, and key events in GA4.

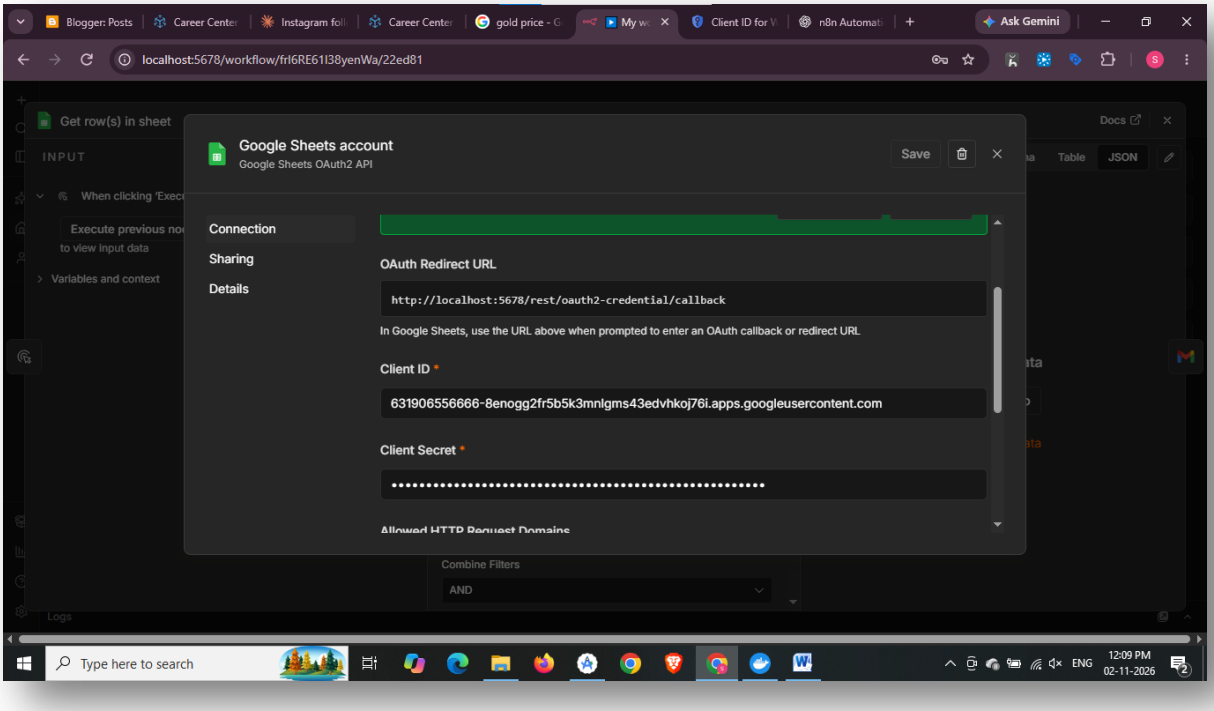

Conclusion

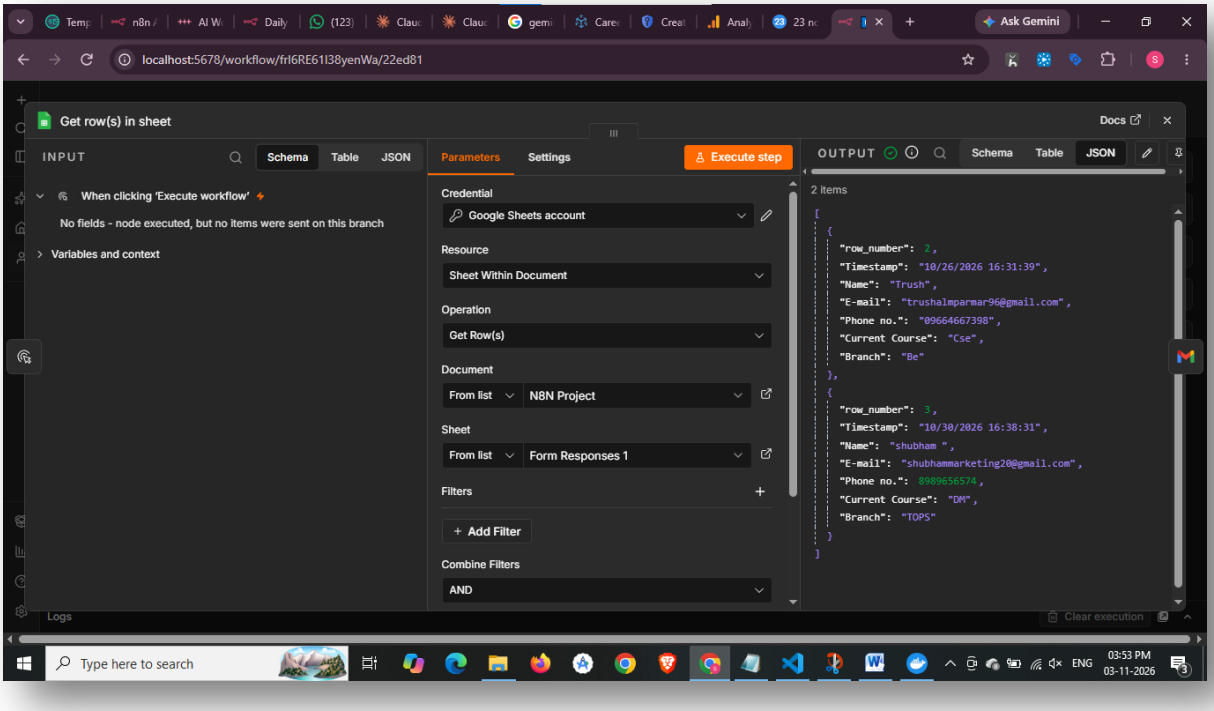

Google Analytics AI Insights and anomaly detection help marketers identify unusual traffic changes, explore potential reasons for performance fluctuations, and discover opportunities to improve engagement. Combining these insights with human analysis helps businesses make more informed marketing decisions.

5. ChatGPT Guide – Integrating n8n with Google Analytics and Telegram

Connect n8n with Google Analytics and Telegram

1. Objective

To create an automated workflow using n8n, Google Analytics and Telegram that sends daily website traffic reports to a Telegram channel at 9 AM.

2. ChatGPT prompt used

Give me a simple step-by-step guide to connect n8n with Google Analytics and Telegram. I want to automatically get daily website visits and the top 3 most-viewed pages from Google Analytics and send the report to my private Telegram channel every day at 9 AM. Also explain common errors and their solutions.

3. Steps generated by ChatGPT

Step 1: Create an n8n account

- Visit https://n8n.io/
- Create a free account.
- Click Create Workflow.
- Name it Daily Website Report.

Step 2: Connect Google Analytics

- Open https://analytics.google.com/
- Select your website property.
- Get your GA4 Property ID.
- Connect Google Analytics with n8n using Google OAuth2 credentials.

Step 3: Get website traffic data

- Add an HTTP Request node in n8n.
- Connect it to Google Analytics Data API.
- Fetch total website sessions for yesterday.
- Fetch the top 3 pages based on page views.

Step 4: Create a Telegram bot

- Open Telegram.
- Search for `@BotFather`.
- Send `/start` and `/newbot`.
- Create your bot.
- Copy the Bot Token.

Step 5: Create a Telegram channel

- Create a new private Telegram channel.
- Add your bot as an administrator.
- Give it permission to send messages.

Step 6: Connect Telegram with n8n

- Add a Telegram node.
- Select Send Message.
- Enter your Bot Token.
- Enter your private channel Chat ID.

Step 7: Schedule the report

- Add a Schedule Trigger node.
- Select Every Day.
- Set the time to 9:00 AM.
- Set timezone to Asia/Kolkata.

Step 8: Connect all nodes

The workflow should look like this:

Schedule Trigger

Every day at 9 AM

Google Analytics

Get website visits and top 3 pages

Code Node

Prepare the report message

Telegram

Send the daily report

Step 9: Test the workflow

- Click Execute Workflow.
- Check whether Google Analytics data is received.
- Check whether Telegram receives the message.
- Activate the workflow.

4. Troubleshooting

Problem	Solution
Google connection error	Check Google credentials.
No website data	Check GA4 Property ID.
Telegram message not sending	Check Bot Token.
Bot not working	Make bot an admin of the channel.
Workflow not running	Check schedule and activate workflow.

5. Expected result

Example of the Telegram report:

Daily Website Report

 Website Analytics Report

 Total Visits: 1,250

 Top 3 Pages:

1. Home – 650 views
2. Products – 420 views
3. Contact – 180 views

Example data only.

6. Conclusion

With n8n, Google Analytics and Telegram, we can automatically collect website traffic data and send daily reports at 9 AM. This saves time and makes website performance tracking easier.
